## Boolean Algebra

Definition: A two-valued Boolean algebra is defined on a set of 2 elements $B=\{0,1\}$ with 3 binary operators OR (+), AND ( $\bullet$ ), and NOT ( ${ }^{\prime}$ ).
3.2 Axioms - need no proof.

A

1. Closure Property.

The result of each operation is an element of $B$.
2. Identity Element.
a) 1 for AND because $\mathrm{x} \bullet 1=1 \bullet \mathrm{x}=\mathrm{x}$.
b) 0 for OR because $\mathrm{x}+0=0+\mathrm{x}=\mathrm{x}$.
3. Commutative Property. From the symmetry of the tables.
a) $x \bullet y=y \bullet x$.
b) $x+y=y+x$.
4. Distributive Property.
a) $x \bullet(y+z)=(x \bullet y)+(x \bullet z)$.
b) $x+(y \bullet z)=(x+y) \bullet(x+z)$.

To show that this is true, we need to show that for any value of binary variables $x, y$, and $z, x \bullet(y+z)$ will have the same value as $(\mathrm{x} \bullet \mathrm{y})+(\mathrm{x} \bullet \mathrm{z})$.

| $x$ | $y$ | $z$ | $y+z$ | $\boldsymbol{x}(\boldsymbol{y}+z)$ | $x y$ | $x z$ | $(x y)+(x z)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | $\mathbf{0}$ | 0 | 0 | $\mathbf{0}$ |
| 0 | 0 | 1 | 1 | $\mathbf{0}$ | 0 | 0 | $\mathbf{0}$ |
| 0 | 1 | 0 | 1 | $\mathbf{0}$ | 0 | 0 | $\mathbf{0}$ |
| 0 | 1 | 1 | 1 | $\mathbf{0}$ | 0 | 0 | $\mathbf{0}$ |
| 1 | 0 | 0 | 0 | $\mathbf{0}$ | 0 | 0 | $\mathbf{0}$ |
| 1 | 0 | 1 | 1 | $\mathbf{1}$ | 0 | 1 | $\mathbf{1}$ |
| 1 | 1 | 0 | 1 | $\mathbf{1}$ | 1 | 0 | $\mathbf{1}$ |
| 1 | 1 | 1 | 1 | $\mathbf{1}$ | 1 | 1 | $\mathbf{1}$ |

5. Complement Element. For every $x \in B$, there exists a complement element $x^{\prime} \in B$ such that:
a) $x+x^{\prime}=1$
$0+0^{\prime}=0+1=1$ and $1+1^{\prime}=1+0=1$
b) $x \cdot x^{\prime}=0$
$0 \bullet 0^{\prime}=0 \bullet 1=0$ and $1 \bullet 1^{\prime}=1 \bullet 0=0$
6. Cardinality Bound. There are at least 2 elements $x, y \in B$ such that $x \neq y .0 \neq 1$.
3.3 Basic Theorems - need to be proven.
7. Idempotency.
a) $x+x=x$.
b) $x \bullet x=x$.
8. a) $x+1=1$.
b) $x \bullet 0=0$.
9. Absorption.
a) $y x+x=x$
b) $(y+x) x=x$
10. Involution.
a) $\left(x^{\prime}\right)^{\prime}=x$
11. Associative.
a) $(x+y)+z=x+(y+z)$
b) $x(y z)=(x y) z$

$$
\begin{aligned}
& \text { Proof of } 1 \mathrm{a}) \\
& \begin{aligned}
x+x & =(x+x) \bullet 1 \\
& =(x+x)\left(x+x^{\prime}\right) \\
& =x+x x^{\prime} \\
& =x+0 \\
& =x
\end{aligned}
\end{aligned}
$$

Proof of 3a)

| $y x+x$ | $=y x+1 x$ |  | by Axiom 2a |
| ---: | :--- | ---: | :--- |
|  | $=x(y+1)$ |  | by Axiom 4a |
|  | $=x 1$ |  | by Theorem 2a |
|  | $=x$ |  | by Axiom 2a |

Proof of 3b)
$(y+x) x=x y+x x \quad$ by Axiom 4a
$=x y+x$
$=x$
by Theorem 1b
by Theorem 3a

Proof of $3 b$ )

| $\boldsymbol{x}$ | $y$ | $y+x$ | $(\boldsymbol{y}+\boldsymbol{x}) \boldsymbol{x}$ |
| :---: | :---: | :---: | :---: |
| $\mathbf{0}$ | 0 | 0 | $\mathbf{0}$ |
| $\mathbf{0}$ | 1 | 1 | $\mathbf{0}$ |
| $\mathbf{1}$ | 0 | 1 | $\mathbf{1}$ |
| $\mathbf{1}$ | 1 | 1 | $\mathbf{1}$ |

## Duality Principle.

This principle states that any algebraic equality derived from these axioms will still be valid whenever the OR and AND operators, and identity elements 0 and 1, have been interchanged. i.e. changing every OR into AND and vice versa, and every 0 into 1 and vice versa.
Ex. Theorem 1b) follows from Theorem 1a) by the duality principle.

### 3.4 Boolean Functions

Boolean functions are formed from binary variables and the Boolean operators AND, OR, and NOT. For a given value of the variables, the value of the function is either 0 or 1. e.g.

This function equals 1 if:
$x=1$ and $y=1$ (doesn't matter what $z$ is)
$x=1, y=0$, and $z=1$
$x=0, y=1$, and $z=1$
otherwise, $F_{1}=0$.

Boolean functions can also be defined by a truth table:

| Variable Values |  |  | Function Values |  |
| :---: | :---: | :---: | :---: | :---: |
| $x$ | $y$ | $z$ | $F_{1}$ | $F_{1}{ }^{\prime}$ |
| 0 | 0 | 0 | 0 | 1 |
| 0 | 0 | 1 | 0 | 1 |
| 0 | 1 | 0 | 0 | 1 |
| 0 | 1 | 1 | 1 | 0 |
| 1 | 0 | 0 | 0 | 1 |
| 1 | 0 | 1 | 1 | 0 |
| 1 | 1 | 0 | 1 | 0 |
| 1 | 1 | 1 | 1 | 0 |

$$
\begin{aligned}
x y z+x y z^{\prime} & =x y\left(z+z^{\prime}\right) \\
& =x y(1) \\
& =x y
\end{aligned}
$$

### 3.4.1 Complement of a Function

The complement of any function $F$ is $F^{\prime}$. Its value can be obtained by interchanging the 0 's for 1 's and 1 's for 0 's in the value of $F$.

There are two ways to determine the algebraic expression for the complement of a function:

1. Apply the generalized form of De Morgan's Law as many times as necessary.

Ex. $F^{\prime}=\left(x y+x y^{\prime} z+x^{\prime} y z\right)^{\prime}$

$$
\begin{aligned}
& =(x y)^{\prime}\left(x y^{\prime} z\right)^{\prime}\left(x^{\prime} y z\right)^{\prime} \\
& =\left(x^{\prime}+y^{\prime}\right)\left(x^{\prime}+y+z^{\prime}\right)\left(x+y^{\prime}+z^{\prime}\right)
\end{aligned}
$$

Difficult to see when $F^{\prime}=1$. Easier to see when $F^{\prime}=0 . F^{\prime}=0$ when each term is 0.
2. Use the duality principle, i.e. interchange the AND and OR operators, and by complementing each literal.

Ex. $(x y) \Rightarrow\left(x^{\prime}+y^{\prime}\right)$
$\left(x y^{\prime} z\right) \Rightarrow\left(x^{\prime}+y+z^{\prime}\right)$
$\left(x^{\prime} y z\right) \Rightarrow\left(x+y^{\prime}+z^{\prime}\right)$
therefore, $\left(\begin{array}{ll}x & y\end{array}\right)+\left(x y^{\prime} z\right)+\left(x^{\prime} y z\right) \Rightarrow\left(x^{\prime}+y^{\prime}\right)\left(x^{\prime}+y+z^{\prime}\right)\left(x+y^{\prime}+z^{\prime}\right)$
The same function can be specified by two or more different algebraic expressions.

### 3.4.2 Graphic representation

Boolean functions can be expressed graphically by connecting together AND, OR, and NOT operators, as specified by the algebraic expression that was used to define the function.
Ex. $F_{1}=(x y)+\left(x y^{\prime} z\right)+\left(x^{\prime} y z\right)$
